SUBCELLULAR LOCATION: NUCLEAR (POTENTIAL).
DEVELOPMENTAL STAGE: PIRST APPEARS IN THE GERMARIUM AND ACCUMULATES IN NURSE CELLS DURING COGENESIS. STORED IN THE BUT IS RAPIDLY LOST IN THE EMBRYOS EXCEPT FOR ITS CONTINUED PRESENCE IN THE GERM LINE PRECURSOR POLE CELLS.
SIMILARITY: Contains 4 C2H2-type zinc fingers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A56038; A56038.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       l-Ninio M.T.M., Terracol R., Kai

CATALYTIC ACTIVITY: NAD(+) + {ADP-D-ribosyl} (N)-acceptor = nicotinamide + {ADP-D-ribosyl} (N+1)-acceptor.

SUBUNIT: Oligomerizes and associates with TNKS2. Interacts with the cytoplasmic domain of LNPEP/Otase in SLC2A4/GLUT4-vesicles. Binds to the N-terminus of telomeric TRF1 via the ANK repeats. SUBCELULAR LOCATION: Cytoplasmic, associated with the Golgi and with juxtanuclear SLC2A4/GLUT4-vesicles. A minor proportion is also found at nuclear pore complexes and around the pericentriolar matrix of mitotic centromeres. During interphase, a small fraction of TNKS is found in the nucleus, associated with TRF1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SIMILARITY: Belongs to the PARP family.
SIMILARITY: Contains 15 ANK repeats.
SIMILARITY: Contains 1 sterile alpha motif (SAM) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       TISSUE SPECIFICITY: Ubiquitous; highest levels in testis. "DNA sequence of genes 38 encoding a receptor-recognizing pro
bacteriophages T2, K3 and of K3 host range mutants.";

J. Mol. Biol. 194:31-99(1987)

-i- FUNCTION: V938 is at the tip of the long tail fibers and
the phage recognition site for the cellular receptor.

-i- MISCELLANEOUS: THIS PHAGE USE OUTER MEMBRANE PROTEINS OMP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SEQUENCE

Biol. Evol. 10:127-139(1993).

Mol. Biol. Evol. 10:127-139(1993).

-i- FUNCTION: Essential for biological clock functions. Determines the period length of circadian and ultradian rhythms; an increase in PER dosage leads to shortened circadian rhythms and a decrease leads to lengthened circadian rhythms. Essential for the circadian rhythmicity of locomotor activity, eclosion behavior, and for the rhythmic component of the male courtship song that originates in the thoracic nervous system. The biological cycle depends on the rhythmic formation and nuclear localization of the TIM. PER complex. Light induces the degradation of TIM, which promotes elimination of PER. Nuclear activity of the heterodimer coordinatively regulates PER and TIM transcription through a negative feedback loop. Behaves as a negative element in circadian transcriptional loop. Does not appear to bind DNA, suggesting indirect transcriptional inhibition (By similarity).

-i- SUBUNIT: Forms heterodimer with timeless (TIM); the complex then translocates into the nucleus (By similarity).

-i- SUBCILLIAR LOCATION: Nuclear at specific periods of the day. First accumulates in the perinuclear region about one hour before translocation into the nucleus. Interaction with Tim is required for nuclear localization (By similarity).

-i- FIMIS THE STABILITY OF PER MONOMER AND IN THE FORMATION OF HETERODIMER PER-TIM (BY SIMILARITY).

-i- SIMILARITY: Contains 2 PAS (PER-ARNT-SIM) dimerization domains.

-i- SIMILARITY: Contains 1 PAS-associated C-terminal (PAC) domain.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.

Disclosure; Page 136; 139pp; English.

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (I) use of thin aggregative fimbriae (SEF17/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant AgfA, CegA and AgfA-homologue fimbria mubunits, respectively; (2) directing recombination of a recombinant gene into the chromosome of the homologous species; (3) directing recombination of a recombinant gene into the chromosome of the homologous species; (3) directing recombination of a recombinant gene into the chromosome of the homologous species; (3) directing recombination of a recombinant gene back into the chromosome of the homologous species,

(I) is C useful for the expression of recombinant AgfA protein which is useful for C eliciting an immune response in an animal. In a fimbrial presentation C system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the C immunogenicity and adhesion properties relevant for an efficient live c vaccine, the carrier fimbrial subunit proteins are usually strong C immunogens, which may be important for directing an immune response C against the inserted epicope, and hybrid fimbriae are easy and C inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a recombinant agfA gene (I) where a CC segment of the gene has been replaced by a segment of a foreign DNA CC sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbriae (SEF1/TAF) nucleation depended CC assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant AgfA, combination of a recombinant gene into the chromosome of the homologous species; (3) directing recombination of a recombination of a recombinant gene into the chromosome of the back into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant AgfA grotein containing a replacement segment or segments of foreign amino CC enterobacteriaceae host cell, from the host cell and introducing the polymer into the expression of recombinant AgfA protein which is useful for useful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a fimbrial presentation conjunction with a carrier or diluent. (I) is conjuncted the heterologous antigens are presented in high numbers (up to system the heterologous antigens are presented in high numbers (up to immunogenicity and adhesion properties relevant for an efficient live capainst the inserted epitope, and hybrid fimbria are usually strong cimmunogens, which may be important for directing an immune response conjunction of the novement invention. The present sequence is given in the exemplification of the novement invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbriae (SEF17/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant AgfA, CsgA and AgfA-homologue fimbrin subunits, respectively; (2) directing recombination of a recombinant gene into the chromosome of the homologous species; (3) directing recombination of a recombinant gene back into the chromosome of the homologous species, replacing the native

Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
